The invention relates to a novel isolated NOVX polypeptide. The colypeptide demonstrates cytostatic, antiarteriosclerotic, antidiabetic, antiasthmatic, antiallergic, antianflammatory, respiratory, antiasthmatic, dermatological, antiabacterial, cerebroprotective, cardiant, haemostatic, hypotensive, hepatotropic, cardiant, haemostatic, indoctropic, neuroprotective, anorectic, nootropic, antialoer, muscular, endocrine, cophthalmological, osteopathic, antipporiatic, endocrine, ophthalmological, osteopathic, antipporiatic, endocrine, cophthalmological, osteopathic, antipporiatic, endocrine, cophthalmological, osteopathic, antipporiatic, or anticonvulsant, cophthalmological, osteopathic, antiporiatic, antiporatic, antiporatic, antiporatic, cophthalmological, osteopathic, antiporation anticonvulsant, continued and osteopathic, antiporatic, antiporation anticonvulsant, continued as crivities, nucleic antibody of the cinvention may be useful for treating or preventing a NOVX-associated disorder, such as cardiomyopathy, atherosclerosis, diabetes or a disorder related to cell signal processing and metabolic pathway modulation. Furthernore, the NOVX polypeptides may be useful for diagnosing, treating cor preventing diseases such as asthmia, allergies, emphysema, autoimmune disease, graft-versus-host disease, arthritis, cancer, stroke, consenting as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine or pharmacogenomics. The current sequence is that of a protein of the invention which is related to human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New NOVX polypeptides and nucleic acid molecules, useful for diagnosing, preventing or treating NOVX-associated polypeptide disorder, e.g. cardiomyopathy, atherosclerosis, diabetes, cancer, Parkinson's disease or

whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of elecamining the presence or absence of a pathological call in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host calls comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the polypeptides and mucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for disgnosing, prognosing and treating cancer and other conditions such as psoriasis, ischaemia, heart disease, a theoretic acids in inflammatory diseases, autoimmune diseases, retinal neovascularistaion syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
fibrotic disorder; psoriasis; ischaemia; heart disease; atherosclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

                                                                                                                                                          ö
polypeptides and nucleic acids. The nucleic acids, polypeptides, and machods are useful for diagnosing, prognosing and treating cancer and other conditions euch as psoriasis, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal neovascularistation syndromes, scarring and uterine fibroids. They may also be useful in wound healing and in contraception. The present sequence represents a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated human mechanical stress-induced 608 nucleic acid molecule. The polypeptide encoded by the nucleic acid molecule is identified as human protein 608 (or OCP), or a functional portion of protein 608 or Adlican-2, or a polypeptide which is at least substantially homologous to it. The 608 polynucleotides and polypeptides are useful for disgnosing, treating, preventing and controlling osteoperosis, osteosacoma, osteoperial osteoperosis, osteosclerosis, osteosclerosis, represents a human OCP protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human mechanical stress-induced 608 nucleic acid and polypeptide, useful for diagnosing, treating, preventing and controlling osteoporosis, osteosarcoma, osteosarthritis, periodontitis, or bone fractures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual determinal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of a gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue samples, where a higher level of protein expression. The mit is soft tissue samples, where a higher level presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue ascoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma upregulated
                                                                                                                                                                                                                                                                                                                                                                                                                                                          soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specification per se but was submitted in CD format by the inventor.

Characterizing the state of a neoplastic disease in a subject by comparing the pattern of determined expression levels of marker genes in a biological sample with reference patterns of expression levels.
                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method for characterizing the state of neoplastic disease in a subject comprising determining the pattern of expression levels of at least 6, 8,10,15, 20, 30, 47 or 67 marker genes in a biological sample, comparing the pattern of expression levels with reference patterns of expression levels and characterizing the state of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           subject, preferably breast cancer, in gene therapy and for screening for compounds having a curative effect on a neoplastic disease. The current sequence is that of the human breast cancer marker RAD52 protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                  the neoplastic disease in the subject from the outcome of the comparison The method of the invention demonstrates cytostatic applications and may be useful in characterizing the state of a neoplastic disease in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          bladder cancer (BC), or monitoring its progression, that uses (I), (II) or agents (Z) that inhibit, or bind to, (I) or (II), labelled with a reporter; and (3) a method for treating BC that uses (I), (II) or (Z). (I) and (II) have cytostatic activity. (I) and (II) can be used to detect (and monitor progression of) bladder cancer (BC), or the risk of developing it; to screen for specific binding agents (Z), and to treat BC. (Z) are also useful as diagnostic and therapeutic agents. The present sequence represents a human amino acid sequence associated with bladder cancer, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes nucleic acids (I) associated with bladder cancer tissue. Also described: (1) peptides and proteins (II) containing an amino acid sequence encoded by (I); (2) a method for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acids, and encoded proteins, from bladder cancer tissue, useful for diagnosis, treatment and in screening for specific binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  neoplasm; tumor marker; cytostatic; breast tumor; gene therapy; RAD52

```
The invention relates to detecting differential expression of one or more nucleic acid sequences (appearing as AEA04356-AEA0448 in a biological sample comprising obtaining the sample from a subject, and detecting a canaple comparising obtaining the sample from a subject, and detecting a relative to a control expression level of one or more nucleic acid sequences, is now also included are detecting comparising the expression level of one or more nucleic acid sequences in a biological sample from the subject (comprising comparising the expression level of one or more nucleic acid sequences in a biological sample from the subject (comprising comparing the expression level of the nucleic acid sequences is indicative of cancer or pre-malignant condition), moritoring the onset (or progression, or regression) level of the nucleic acid sequences is indicative of cancer or pre-malignant condition), in a subject (by detecting in a biological sample of the aubject (by detecting in a biological sample of the subject (comprisaing detecting in the expression level is indicative of progression of cancer or its pre-malignant condition in the subject (comprisaing detecting in a biological sample of the subject, determining precedences, comparing the expression level where a concer or its pre-malignant condition in a subject (comprisaing detecting in a biological sample of the subject, the expression level with a reference or call sequences, comparing the expression level with a subject (comprisaing detecting in a subject (comparing the expression level with a subject, determining the efficacy of a test compound for inhibiting cancer in a subject, inhibiting cancer in a subject, a left comparing the efficacy of a test comparing the expression level with a subject (comparisor) of a test comparing the end of a polypeptide end or the end of a polypeptide sequence, and detecting in a biologi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cancer), monitoring the onset, progression, or regression of cancer or a pre-malignant condition, or determining prognosis for cancer or its pre-malignant condition in a subject, or for determining the efficacy of a test compound for inhibiting cancer in a subject. The compound is useful for inhibiting cancer in a subject. The antibodies may also be used to treat cancer. The present sequence is a protein from a human gene overexpressed in cancer samples.
                  Detecting expression of one or more nucleic acid sequences in biological sample, useful for detecting cancer, comprises detecting a change in the expression level of one or more nucleic acid sequences relative to a
                                                                                                                                                                           Claim 20; SEQ ID NO 124; 256pp; English.
                                                                                                                    control expression level.

2003-354645/33. N-PSDB; ACC00398 New human cell adhesion and extracellular matrix proteins (CADECM), useful for diagnosing, treating or preventing disorders associated with aberrant CADECM expression, e.g. cancer, AIDS, atherosclerosis, allergies or stroke.

Claim 1; Page 178-185; 234pp; English.

The present invention relates to novel human cell adhesion and extracellular matrix proteins, CADECM-1 to CADECM-22, and their coding sequences sequences (ACC00392-ACC00413 and ABR40104-ABR40125). The coding sequences and proteins are useful in diagnosing, treating and preventing disorders associated with aberrant expression of CADECM, such as immune system disorders (e.g. AIDS or allergies), neurological disorders (e.g. stroke, Parkinson's disease or epilepsy), developmental disorders (e.g. bown's syndrome or cerebral palsy), connective tissue disorders (e.g. systemic lupus erythematosus), genetic disorders (e.g. Alport's syndrome) or cell proliferative disorders or atherosclerosis)

                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and mapping, identification of mutations in dispnostice for generic disorders or other traits to assess blodiversity represent cond to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and and cond sequences. Agonomological expensions of mino acid sequences of the invention. Note: The sequence data for this parent did not appear in the printed specification, but was obtained in celetronic format directly from WIPO at (IP) will be printed sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recaction (PCR) primers, oligomers, and for chromosome and spen mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging polypeptide and polymucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30317 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 5266;

```
The invention comprises a modified cell containing a heterologous nucleic acid encoding an artificial transcription factor that confers stress resistance to the modified cell. The modified cell of the invention is useful for altering a phenotypic trait of a cell or organism. The present amino acid sequence represents a transcriptional activation domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New modified cell comprising a heterologous nucleic acid encoding an artificial transcription factor that confers stress resistance, useful for altering a phenotypic trait of a cell or organism.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes substantiarly purinter from the present invention describes substantiarly purinted from the proteins given in ABP00010 to ABP11500. ORFX proteins are useful for proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide syndrome associated in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhoats of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencias and disorders, infectious disease, autoimmune thyroiditis, mysthenia gravis, graft-versus-host disease and autoimmune thyroiditis, mysthenia gravis, graft-versus-host disease and autoimmune thyroiditis, mysthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also cusful for treating burns, inclaions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodottis, corperiodottis, mysthenia gravis, graft-versus-host protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. NB. The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .<u>;</u>

                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                     The invention relates to evaluating several cellular genes. The method involves providing several cells containing nucleic acid encoding confidence tartificial, chimeric transcription factor, expression nucleic acids in cells, evaluating expression of several genes in cells to provide expression information and identifying from expression confidence information, a set of two or more genes whose expression altered by first and second transcription factors. The nucleic acids encoding the different artificial, chimeric transcription factors comprise a comprise an extificial, chimeric transcription factor confidence and extificial, chimeric transcription factor comprises a first zinc finger domain, and further comprises a second and third zinc finger domain. The first zinc finger domain is a naturally occurring zinc finger domain. The first zinc finger domain is a mammalian zinc finger domain. Bach cell of several cells is an animal or human cell. The method is useful for evaluating several callular genes. The present sequence represents the amino acid sequence collular genes. The present sequence represents the amino acid sequence collular genes.
                                                                                                                                                                                                                                                                                                                                                                                                                        ä
                                                                  Evaluating cellular genes by expressing nucleic acid encoding different artificial, chimeric transcription factor in cells and identifying set of genes altered by transcription factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA binding domain; zinc finger domain; VEGF, VEGF-A; transcription activation domain; transcription repression domain; protein transduction domain; p65; VP16 activation domain; Kid; KOX repression domain; TAT protein; VP22 protein; Antennapedia homeodomain; cytostatic; antiinflammatory; angiogenesis; neoplastic disorder; inflammatory disorder; angiogenesis-based disorder.

This invention relates to a novel polypeptide comprising a DNA binding domain that includes a plurality of zinc finger domains, where the DNA commain that includes a plurality of zinc finger domains, where the DNA compined to a site in a VECF gene, and at least two of the zinc finger domains each include respective zinc finger domain motifs comprises in the VECF gene expression. The polypeptide further comprises a transcription activation domain, a transcription repression compines p65 or VP16 activation domain. The transcription activation compains protein transduction domain activation domain. The transcription activation compains post of the invention may be useful for the production compounds with a cytostatic or antiinflammatory activity acting as of compounds with a cytostatic or antiinflammatory activity acting as angiogenesis modulators. The polypeptides and nucleic acids are useful for for modulating angiogenesis whilst the compounds may be useful for preventing or treating a neoplastic disorder, an inflammatory disorder, or an anglogenesis-based disorder. The present sequence is that of a cytostation domain which is related to the invention.
                                                    New polypeptide comprising a DNA binding domain that includes a plurality of zinc finger domains, and at least two of the zinc finger domains each include respective zinc finger domain motifs, useful for modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cellular transport; neoplasm; inflammation; angiogenesis disorder; UME6; cytostatic; antiinflammatory; antiangiogenic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New chimeric protein comprising zinc finger domains and a heterologous protein transduction domain, useful in preparing a composition for treating a subject having or being suspected of having neoplastic or inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5;

                                                                                                                                                                                                                                  ð
                   The invention relates to a chimeric protein comprising zinc finger

domains and a heterologous protein transduction domain for translocating

the protein across a cellular membrane. The invention also relates to a

pharmaceutical composition comprising the chimeric protein and a carrier,

a nucleic acid comprising a coding sequence that encodes a polypeptide

that comprises a zinc finger domain and a heterologous protein

transduction domain, located N-terminal to the zinc finger domain, a

c transduction domain, located N-terminal to the zinc finger domain, a

that contains an exogenous polypeptide, but not a nucleic acid that

c altering gene expression in a cell of a subject, a method of

that contains an exogenous polypeptide, but not a nucleic acid that

c encodes the exogenous polypeptide, but not a nucleic acid that

c encodes the exogenous polypeptide, but not a nucleic acid that

c encodes the exogenous polypeptide. The chimeric protein that is

c heterologous to the DNA binding domain and a method for preparing a

c transducible DNA binding polypeptide. The chimeric protein is useful in

preparing a composition for treating a subject having or being suspected

of having a neoplastic, inflammatory or angiogenesis-based disorder. This

sequence represents the yeast UME6 repression domain used in the scope of

the invention.
                                                                                                                                                                                                                                                                                                                                                ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. ä
are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Offlice
                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises a modified cell containing a heterologous nucleic acid encoding an artificial transcription factor that confers stress resistance to the modified cell. The modified cell of the invention is useful for altering a phenotypic trait of a cell or organism. The present amino acid sequence represents a protein which contains zinc finger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New modified cell comprising a heterologous nucleic acid encoding an artificial transcription factor that confers stress resistance, useful for altering a phenotypic trait of a cell or organism.
                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modified cell; artificial transcription factor; stress resistance; phenotypic trait alteration; zinc finger domain.

```
New modified cell comprising a heterologous nucleic acid encoding an artificial transcription factor that confers stress resistance, useful for altering a phenotypic trait of a cell or organism.
                                                                                                                                                                                                                                                      modified cell; artificial transcription factor; stress resistance; phenotypic trait alteration; zinc finger domain.
                                                                                                                                                                                             Zinc finger domain-containing protein #2.
ADL33682 standard; protein; 238 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26-APR-2002; 2002US-0376053P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to evaluating several cellular genes. The method involves providing several cells containing nucleic acid encoding different artificial, chimeric transcription factor, expressing nucleic acids in cells, evaluating expression of several genes in cells to provide expression information and identifying from expression is altered by information, a set of two or more genes whose expression is altered by circumation, a set of two or more genes whose expression is altered by information, a set of two or more genes whose expression is altered by circumation, and encoding the different artificial, chimeric transcription factors comprise a condition acids, where each member of the preselected set of nucleic acids encodes an artificial, chimeric transcription factor comprises an artificial, chimeric transcription factor comprises a first zinc finger domain, and further comprises a second and third zinc finger domains. The first zinc finger domain is a manumalian zinc finger domain. Each cell of several cells is an animal or human cell. The method is useful for evaluating several cellular genes. The invention comprises a modified cell containing a heterologous nucleic acid encoding an artificial transcription factor that confers stress resistance to the modified cell. The modified cell of the invention is useful for altering a phenotypic trait of a cell or organism. The present amino acid sequence represents a protein which contains zinc finger

involves providing several cells containing nucleic acid encoding different artificial, chimeric transcription factor, expressing nucleic acids in cells, evaluating expression of several genes in cells to provide expression information and identifying from expression information and identifying from expression is altered by first and second transcription factors. The nucleic acids encoding the different artificial, chimeric transcription factors comprise a preselected set of nucleic acids, where each member of the preselected set of nucleic acids encodes an artificial, chimeric transcription factor that can alter a cellular phenotype. Each artificial, chimeric transcription factor comprises a second and third zinc finger domains. The first zinc finger comprises
                                                                                                            The invention comprises a modified cell containing a heterologous nucleic acid encoding an artificial transcription factor that confers stress resistance to the modified cell. The modified cell of the invention is useful for altering a phenotypic trait of a cell or organism. The present amino acid sequence represents a protein which contains zinc finger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Evaluating cellular genes by expressing nucleic acid encoding different artificial, chimeric transcription factor in cells and identifying set of genes altered by transcription factors.
New modified cell comprising a heterologous nucleic acid encoding an artificial transcription factor that confers stress resistance, useful for altering a phenotypic trait of a cell or organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to evaluating several cellular genes. The method

The method involves providing several cells containing nucleic acid encoding different artificial, chimeric transcription factor, expressing nucleic acids in cells, evaluating expression of several genes in cells to provide expression information and identifying from expression information and identifying from expression information and identifying from expression is altered by first and second transcription factors. The nucleic acids encoding the different artificial, chimeric transcription factors comprise a preselected set of nucleic acids, where each member of the preselected set of nucleic acids encodes an artificial, chimeric transcription factor that can alter a cellular phenotype. Bach artificial, chimeric transcription factor comprises a first zinc finger domain, and further comprises a second and third zinc finger domains. The first zinc finger comprises
                                                                                                                                                                                                                                                                                                                    1;
domain is a naturally occurring zinc finger domain. The first zinc finger domain is a mammalian zinc finger domain. Each cell of several cells is an animal or human cell. The method is useful for evaluating several cellular genes. Sequences ADM72637-ADM72647 represents the amino acid sequences of zinc finger domains (ZFD) of K1 to K11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Evaluating cellular genes by expressing nucleic acid encoding different artificial, chimeric transcription factor in cells and identifying set of

involves providing several calls containing nucleic acid encoding different artificial, chimeric transcription factor, expressing nucleic acides in cells to acides in cells to acides in cells evaluating expression of several genes in cells to provide expression information and identifying from expression cells to information, a set of two or more genes whose expression is altered by first and second transcription factors. The nucleic acids encoding the different artificial, chimeric transcription factors comprise a preselected set of nucleic acids, where each member of the preselected in the can alter a cellular phenotype. Each artificial, chimeric transcription factor comprises a first zinc finger domain, and further comprises a second and third zinc finger domains. The first zinc finger domain is a naturally occurring zinc finger domain. The first zinc finger domain is a mammalian zinc finger domain. Bach cell of several cells is an animal or human cell. The method is useful for evaluating several.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  invention relates to evaluating several cellular genes. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cellular genes. Sequences ADM72637-ADM72647 represents the amino acid sequences of zinc finger domains (ZFD) of K1 to K11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .,

comprises a second and third zinc finger domains. The first zinc finger domain is a naturally occurring zinc finger domain. The first zinc finger domain is a mammalian zinc finger domain. Each cell of several cells is

an animal or human cell. The method is useful for evaluating several cellular genes. Sequences ADM72637-ADM72647 represents the amino acid sequences of zinc finger domains (ZFD) of K1 to K11.

Sequence 238 AA;

Evaluating cellular genes by expressing nucleic acid encoding different artificial, chimeric transcription factor in cells and identifying set of genes altered by transcription factors.

New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.

Claim 1; SEQ ID NO 3661; 2686pp; English.

This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to conditions obtained by an oligo-capping method, where none of these clones are identical to any known human mankas. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the ODNA molecules. As such, these concludes are useful for diagnostic markers or therapeutic targets for molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating ostcoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia, short memory and various cancers, as well as for maintening equilibrium of sense or morbid cancers, for treating emotional reaction, fear response and panic. Accordingly, they exhibit ostcopathic, neuroprotective, nootropic, antiparkinsonian, excepted by a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but to the obtained on CD-ROM from the European Patent Office, Vienna Sub-

-!- TISSUE SPECIFICITY: Fibroblast specific.
-!- INDUCTION: In fibroblasts at times and sites of tissue remodeling during development, tissue repair, and carcinogenesis.
-!- PTM: N-glycosylated.
-!- PTM: The N-terminus may be blocked.
-!- PTM: Belongs to the peptidase S9B family.
                                                                                                                                                                                                                                      Goldstein L.A., Chen W.-T.; "Identification of an alternatively spliced seprase mRNA that encodes a novel intracellular isoform.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synoplania (Potential).

Signal-anchor for type II membrane protein (Potential).

Extracellular (Potential).

Charge relay system (By similarity).

N-linked (GLONAC...) (Potential).

N-linked (GLONAC...) (Potential).

N-linked (GLONAC...) (Potential).

N-linked (GLONAC...) (Potential).

Mishing (in isoform 2).
